AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1-4. (cancelled)

5. (currently amended) A method of making a low-pin-count chip package, said method comprising the steps of:

providing a sheet carrier;

laminating a metal layer on the sheet carrier;

half-etching the metal layer so as to form cavities at predetermined positions thereof;

forming a photoresist layer on the half-etched metal layer;

half-removing the photoresist layer such that only the photoresist within the cavities is left;

forming a metal coating on the surface of the half-etched metal layer which is not covered by the photoresist;

stripping the remaining photoresist within the cavities;

etching the half-etched metal layer using the metal coating as a mask so as to form a plurality of connection pads having a substantially concave profile;

attaching a semiconductor chip onto the sheet carrier;

electrically coupling the semiconductor chip to the connection pads;

forming a package body over the semiconductor chip and the connection pads wherein the substantially concave profile helps to lock the connection pads in the package body;

removing the sheet carrier after the package body is formed, wherein said sheet carrier is completely removed in the step of removing the sheet carrier; and

forming a protective metal flash on the lower surface of the connection pads exposed from the package body.

- 6. (original) The method as claimed in claim 5, wherein the protective metal flash comprises a layer of nickel covering the lower surface of the connection pads, and a layer of metal selected from the group consisted of gold and palladium covering the nickel layer.
- 7. (original) The method as claimed in claim 5, wherein the sheet carrier is a polyimide tape with a layer of silicone adhesive.
- 8. (original) The method as claimed in claim 5, wherein the sheet carrier is a polyester tape with a layer of silicone adhesive.
- 9. (original) The method as claimed in claim 5, wherein the metal coating comprises a layer of nickel covering the surface of the metal layer which is not covered by the photoresist, and a layer of metal selected from the group consisted of gold and palladium covering the nickel layer.

10-13. (cancelled)

14. (currently amended) A method of making a low-pin-count chip package, said method comprising the steps of:

providing a sheet carrier;

laminating a metal layer on the sheet carrier;

half-etching the metal layer so as to form cavities at predetermined positions thereof;

forming a photoresist layer on the half-etched metal layer;

half-removing the photoresist layer such that only the photoresist within the cavities is left;

forming a metal coating on the surface of the half-etched metal layer which is not covered by the photoresist;

stripping the remaining photoresist within the cavities;

etching the half-etched metal layer using the metal coating as a mask so as to form a die pad and a plurality of connection pads having a substantially concave profile;

attaching a semiconductor chip onto the die pad;

electrically coupling the semiconductor chip to the connection pads;

forming a package body over the semiconductor chip and the connection pads wherein the substantially concave profile helps to lock the connection pads in the package body;

removing the sheet carrier after the package body is formed, wherein said sheet carrier is completely removed in the step of removing the sheet carrier; and

forming a protective metal flash on the lower surfaces of the die pad and the connection pads.

- 15. (original) The method as claimed in claim 14, wherein the protective metal flash comprises a layer of nickel covering the lower surfaces of the die pad and the connection pads, and a layer of metal selected from the group consisted of gold and palladium covering the nickel layer.
- 16. (original) The method as claimed in claim 14, wherein the sheet carrier is a polyimide tape with a layer of silicone adhesive.
- 17. (original) The method as claimed in claim 14, wherein the sheet carrier is a polyester tape with a layer of silicone adhesive.
- 18. (original) The method as claimed in claim 14, wherein the metal coating comprises a layer of nickel covering the surface of the metal layer which is not covered by the

photoresist, and a layer of metal selected from the group consisted of gold and palladium covering the nickel layer.

19-20. (canceled)
